

Valorant Data Guide

If you want to learn more about the data used and why they are important, look at this quick guide.

AGENTS & ROLES

1. Duelist

Your primary space-creators and aggressive fraggers. You are assessing their ability to take early fights and output raw damage.

- **fk (First Kills):** Must be the highest on the team. Indicates successful site entry.
- **fk vs fd Ratio:** A high fk is only good if fd (First Deaths) isn't completely canceling it out. Look for a positive differential here.
- **acs (Average Combat Score):** Expected to be the highest. Proves they are getting multi-kills and highly-weighted early frags.
- **adr (Average Damage per Round):** Needs to be exceptionally high, proving they are consistently weakening enemies during their aggressive pushes.
- Duelists are heavily rewarded by the ACS system for taking early engagements and securing opening kills.
- The Baseline (220 to 240 ACS): For an entry Duelist playing Jett or Reyna, an ACS around 240 is the standard expectation. For secondary duelists playing Raze or Phoenix, the expectation sits slightly lower at around 220 ACS.
- The Elite Tier (250+ ACS): The absolute best Duelists in the world consistently push well beyond these baseline numbers. For example, Francis "OXY" Hoang reached a massive 292.8 average ACS during VCT play. Similarly, Xi Lai Gaming's happywei topped the Day 2 playoffs player rankings at VALORANT Masters London 2026 by maintaining an elite 221 ACS over a grueling 174 rounds.

2. Initiator

Your information gatherers and flashers. You are assessing their ability to perfectly time utility to set up the Duelists and the rest of the team.

- **assists:** Should be the absolute highest on the team. Proves their recon darts, stuns, and flashes are directly resulting in teammate kills.
- **kast (Kill, Assist, Survive, Traded):** Needs to be elite (73%+). Initiators are the bridge between the entry players and the backline; they must constantly be involved in the trade-fragging sequences.

- **rating:** A good overarching metric here, as the algorithmic rating rewards the balance of solid fragging combined with high utility assists.
- Initiators must balance their supportive utility usage with raw firepower, meaning their combat output usually falls right in the middle of the pack.
- The Baseline (190 to 205 ACS / 100 ADR): The expectation varies slightly depending on the specific agent being played. A more aggressive Initiator like Skye averages around 205 ACS, whereas a Sova player is expected to hit around 190 ACS. For support-oriented roles like Initiators, hitting roughly 180 ACS and 100 ADR is generally considered a solid average.
- The Sweet Spot (210+ ACS): Pushing above 210 means the player is frequently converting their own utility into multi-kills and acting as a highly reliable secondary fragger alongside their Duelist.

3. Controller

Your smoke players. You are assessing their discipline, map control, and ability to stay alive to execute/retake sites.

- **fd (First Deaths):** Must be incredibly low. A Controller dying first strips the team of all map vision control, which is often a round-losing error.
- **deaths:** Needs to be kept to a minimum. Their smokes are on cooldowns and needed for the entire 100-second duration of the round.
- **kast:** Should be extremely high, heavily anchored by the "Survive" and "Assist" (from blind/decay utility) portions of the metric.

Because their highest priority is staying alive to control the map with smokes, Controllers naturally post some of the lowest raw combat stats on the team.

- The Baseline (180 to 190 ACS / 100 ADR): For a dedicated smoke player, an ACS between 180 and 190 is completely acceptable and considered the overall standard average. Agents like Astra might hover slightly lower, closer to 185 ACS. Maintaining around 100 ADR in this role means they are still outputting reliable damage in neutral gunfights.
- The Elite Tier (200+ ACS): A Controller reaching or exceeding 200 ACS marks a highly impactful player who is surviving the initial chaos, winning crucial late-round clutches, and anchoring sites exceptionally well.

4. Sentinel

Your site-holders and flank-watchers. You are assessing their survivability and efficiency in holding advantageous defensive angles.

- **kast:** Expected to be exceptionally high. Their job is to stay alive, stall pushes, and anchor sites without throwing their lives away.
- **kd_diff (Kill/Death Differential):** Needs to be highly positive. Because Sentinels dictate where the fights happen (using traps and playing passive crossfires), they are structurally set up to secure clean kills while avoiding 50/50 aim duels.
- **fd (First Deaths):** Like Controllers, this must be very low. If a Sentinel dies early, their traps power down and the site is immediately surrendered to the enemy team.

Sentinels rely heavily on strategic positioning and traps rather than aggressive entries, meaning their raw damage numbers are expected to be lower.

The Baseline (180 to 190 ACS): A Sentinel is expected to maintain around 190 ACS. Highly defensive agents like Sage usually average slightly lower, hovering around 180 ACS. However, players who adopt an aggressive "fragging Sage" playstyle can push this expectation closer to 215 ACS.

- The Sweet Spot (200+ ACS): A Sentinel crossing the 200 ACS threshold proves they are locking down their bomb site successfully and securing multiple high-impact kills when the enemy team attempts an execution.
- Controllers (The Architect)
- Because their highest priority is staying alive to control the map with smokes, Controllers naturally post some of the lowest raw combat stats on the team.
- The Baseline (180 to 190 ACS / 100 ADR): For a dedicated smoke player, an ACS between 180 and 190 is completely acceptable and considered the overall standard average. Agents like Astra might hover slightly lower, closer to 185 ACS. Maintaining around 100 ADR in this role means they are still outputting reliable damage in neutral gunfights.
- The Elite Tier (200+ ACS): A Controller reaching or exceeding 200 ACS marks a highly impactful player who is surviving the initial chaos, winning crucial late-round clutches, and anchoring sites exceptionally well.
- slows, nets, and traps that allow their teammates to secure easy cleanup kills.

Metrics used per role in the dashboard:

Role	Primary Metrics	Why	Secondary/Less Useful
Duelist	ACS, ADR, Kills, KD Diff, First Kill, HS%	Their job is to win duels and create openings — these directly measure that	KAST (can stay high even with sloppy deaths)

Role	Primary Metrics	Why	Secondary/Less Useful
Initiator	Assists, KAST, First Death (lower = better), ACS	Utility-driven kills show up as assists; KAST captures "did their info/ashes lead to round impact"	First Kill (not their primary job)
Controller	KAST, Deaths (lower = better), Assists, ADR (moderate is fine)	Controllers play more passively — survival and consistent contribution matter more than raw frags	ACS, Kills (naturally lower by design, not a fair comparison vs duelists)
Sentinel	First Death (lower = better), Deaths (lower = better), KAST, Assists	Anchoring/holding sites means avoiding early deaths and getting trade-kills/info is the priority	ACS, Kills (nice to have, not the core job)
